COMPUTER AIDED DESIGN FOR INSTALLED SOUND SYSTEMS

S. Romeo and K. Jacob

Bose Corporation, Framingham, Mass.

A software package has been developed which can be used by engineers, consultants and contractors to design installed and concert sound systems, using the Apple Mackintosh computer.

The package, which has been developed in conjunction with several leading U.S. sound contractors and theoreticians will be described in demonstration by the authors, covering the selection of parameters programmed into the system. Other topics to be illustrated include dimensional capabilities, prediction of effects, substitution of models, and examples of actual applications where the new technique has been employed.
